Heelift® Boots
The next generation of pressure ulcer prevention and treatment

Heelift Glide Ultra and Heelift Glide move easily over the sheets, which helps keep them in place. That means fewer adjustments and less time spent reapplying the boot. The comfortable design means fewer patient complaints. They are easy to clean – both boots are washable and the interior of Heelift Glide Ultra can simply be wiped clean.

Heelift Glide Ultra and Heelift Glide, like all Heelift Boots, provide a pressure free environment by completely offloading the heel. An affixed pad suspends the heel and redistributes pressure up the calf. An extended forefoot with rounded-edge stitching won’t catch on the sheets. The durable exterior allows the patient’s leg to glide easily across the sheets.

Heelift Glide Ultra features our new UltraTec fluid-repellent interior lining which is soft, comfortable and aids in patient compliance. The inner lining is impermeable – liquid can’t get through. The elevation pad cover is removable to allow for customization to meet specific patient needs.

Heelift Glide Ultra and Heelift Glide are available in Standard, Petite and Bariatric sizes.

The Anti-Rotation Wedge (included with the Heelift Glide Ultra, or available separately with other Heelift Boots) gives you the flexibility needed to stop rotation in immobile patients. The easy to apply, reusable wedge attaches to either side of the boot and prevents rotation.

Since its introduction in 1979, Heelift Classic has helped millions of patients prevent and treat heel pressure ulcers. Over the last few decades, the Heelift Classic and Heelift Basic have allowed facilities to shift their focus from expensive treatment methods to safer, more economical prevention strategies.

At the core of every Heelift Boot you will find a soft double-beveled fixed pad that floats the heel and redistributes pressure. The open design keeps air moving around the foot to prevent heat buildup.
Heelift® AFO
For patients with limited mobility

Heelift AFO Ultra and Heelift AFO are not typical AFO devices. While both products are indicated for conditions treated by conventional AFOs, Heelift AFO boots also provide offloading benefits to help prevent heel ulcers. Additionally, the semi-rigid brace and the outer lining help maintain proper foot position and assist in preventing foot drop deformity.

Heelift AFO Ultra features our new UltraTec fluid-repellent interior lining which is soft, comfortable and aids in patient compliance. The inner lining is impermeable—liquid can’t get through. The elevation pad cover is removable to allow for customization to meet specific patient needs and the Anti-Rotation Wedge gives you the flexibility needed to stop rotation in immobile patients.

Heelift AFO Ultra and Heelift AFO both have a non-slip traction sole that allows limited weight bearing. This assists in transfers from bed, wheelchair, commode, or physical therapy. Assistance is still recommended for ambulating patients. The forefoot strap keeps the boot in place while the soft exterior allows easy movement over the sheets.

Heelift AFO Ultra and Heelift AFO are indicated for the following:

- Treatment/Prevention of foot drop deformity
- Dorsiflexion ankle support for paralyzed legs
- Comfortable night splint
- Treatment/Prevention of plantar flexion contracture
- Treatment of plantar fasciitis
- Treatment of Achilles Tendonitis
